16 17

18 **PURPOSE**

19

This document supplements ISO/IEC 17025, and provides specific guidance on the accreditation of sensory testing laboratories. It gives detailed guidance for the interpretation of ISO/IEC 17025 for those undertaking sensory testing.

This document is intended to be used by user laboratories (accredited and nonaccredited), assessors involved in the evaluation of sensory laboratories and accreditation bodies. It can also be useful for regulatory authorities, laboratory customers and tests report users.

73 **1 INTRODUCTION**

74

79

85

88

97

- The general requirements for accreditation are laid down in the International
 Standard General *requirements for the competence of testing and calibration laboratories* (ISO/IEC 17025). All these requirements must be met by
 laboratories seeking accreditation.
- This document has been produced by the EA Laboratory Committee, Food
 Testing Task Force. This document provides specific guidance on the
 accreditation of sensory testing laboratories. It gives detailed guidance on the
 interpretation of ISO/IEC 17025 for those laboratories undertaking objective
 sensory methods.
- 1.3. ISO/IEC 17025 remains the authoritative document and, in cases of dispute,
 each individual accreditation body will adjudicate on unresolved matters.
- 89 1.4. Sensory analysis is a scientific discipline with a wide field of applications. In the 90 food industry, it is currently a powerful and essential analytical tool, both in the development of new products and in the control of the quality of food as it is 91 used to measure reactions to those characteristics of foods and other materials 92 93 as are perceived by the senses of sight, smell, taste, touch and hearing. This definition embraces both qualitative and quantitative approaches and does not 94 95 discriminate between the sensory attributes being assessed by consumers or trained sensory assessors. 96
- 98 1.5. Examples of the application of sensory analysis include:

99		
100		shelf-life studies
101		product matching
102		product mapping
103		quality control for compliance with product specifications
104		product reformulation
105		taint and off odour/flavour problems
106		product quality
107		product grading
108		
109	1.6.	Specific requirements for hedonic tests are not included in this guide, although
110		some of the requirements established are also applicable. Detailed guidance on
111		hedonic tests can be found in [10].
112		

- 1.7. This document is concerned with the quality of test results and is not specifically
 concerned with health and safety matters. However, laboratory practices should
 conform to national health and safety regulations. It is important to note that in
 some cases health and safety issues may influence on quality of testing and the
 laboratory will be required to take this into account.
- 119 1.8. For the purposes of this document, the terms and definitions given in [2] apply.
- 120 121

118

123 124 SCOPE OF ACCREDITATION 125 2 126 127 2.1 Accreditation bodies will only accredit laboratories for sensory tests that have been fully documented and shown to be under control by demonstrating that the 128 129 laboratory will, within defined limits, obtain the same result, and where possible the laboratory should demonstrate equivalence results with other laboratories. 130 131 132 2.2 Examples of sensory tests that are used in sensory analysis and which can be accredited are: 133 134 135 **Discriminative tests** Triangle test Paired comparison test 136 Duo-trio test 137 138 Ranking 139 **Descriptive tests** Identification of perceived attributes (citation 140 141 frequencies) Quantification of the intensity of attributes 142 using continuous or discontinuous rating 143 scales 144 145 146 The sensory test identification in the scope of accreditation shall clearly establish its nature and identify the sensory properties under analysis for which 147 148 the panel of sensory assessors has been trained. In the case of methods that measure a quantitative response, information on the scale used should be 149 150 included, such as the number of response levels. 151 Identification in the scope of accreditation of terms that do not allow sensory 152 153 assessors to evaluate a sensory property by an objective and accurate sensory 154 response, is not acceptable. This criterion ensures that the panel training can be addressed with valid references to the target sensory descriptors. 155 156 157 The inclusion in the scope of accreditation of sensory properties different from 158 those already accredited in an already accredited sensory test, requires a new 159 evaluation through a formal application for extension of the scope of accreditation. 160 161 162 2.3 It is the responsibility of the laboratory to demonstrate to the accreditation body assessors that meets all the criteria for accreditation. It is a difficult task when 163 164 there are no standard methods, this being a frequent situation in sensory 165 analysis with a few exceptions. 166 Therefore, this document is aimed at covering the main elements that need to 167 2.4 be controlled to ensure compliance with the requirements of the EN ISO / IEC 168 17025 standard, specifically: 169 170 171

172		a) responsibilities, competence requirements and authorisation of staff
173		carrying out the test;
174		b) selection, training and re-training of sensory assessors;
175		c) use of appropriate reference and training materials;
176		d) test procedure;
177		e) maintenance and calibration of equipment;
178 179		 f) on-going quality control (QC) procedures; g) on-going individual sensory assessor and panel performance monitoring;
180		 g) on-going individual sensory assessor and panel performance monitoring; h) the technical records necessary in relation to the performance of sensory
181		tests and related activities.
182		
183	2.5	Tests which are solely performed by only one individual will not be accredited
184		as a sensory test.
185	-	
186	3	PERSONNEL
187		ISO/IEC 17025 clause 6.2
188 189	3.1	Staff
190	3.1	Stall
191	3.1.1.	Typically, the sensory laboratory staff is the panel leader and optionally there
192		may be panel technicians (one or more).
193		
194		The personnel who fulfil the scientific/technical functions of a sensory analysis
195		laboratory is the panel leader.
196		The new end whe fulfil the enductional functions by espiritury the new ellowder
197 198		The personnel who fulfil the operational functions by assisting the panel leader in performing sensory tests, including necessary preparation and identification
190		of the samples before the test and activities after the test e.g. review of primary
200		data and transcription for their treatment is the panel technician.
201		
202		People who perform sensory evaluations of products are the sensory assessors.
203		Usually, they are not included as staff because their primary function is not
204		related to managing tests. Their role is described in paragraph 3.3.
205 206		The responsibilities and the competence requirements of all those involved in
200		sensory testing should be documented.
208		sensery testing should be decamented.
209		The staff in a sensory laboratory shall be authorised by the management and
210		records shall be maintained about their authorisation.
211		
212	3.1.2.	Competence, experience and training of the panel leader and technicians shall
213		be recorded including:
214 215		a) academic qualifications
215		b) external and internal pertinent courses attended
217		c) previous experience
218		
219	3.1.3.	The laboratory shall maintain an up-to-date record of the training that all sensory
220		assessors have received. The purpose of these records is to provide evidence
221		that they have been adequately trained and that their competence to carry out

- 222 accredited tests has been assessed. The records shall be available when is 223 required and shall also include relevant training jobs and re-training, as 224 necessary.
- Where a method or technique is not in regular use, the need to re-train sensory assessors periodically shall be considered. In each case the critical interval shall be established and documented.
- 3.1.4. Detailed guidance on staff responsibilities of sensory laboratories can be found
 in [4].

233 3.2 Panel leader

259

262

264

268

- 3.2.1 The responsibilities for panel leader position shall be formalised as written job
 description. Among them, the panel leader is responsible for organizing,
 planning and supervising the training works of sensory assessors and for
 monitoring them in routine analysis. Detailed information about the panel
 leader's tasks can be found in [12], [13]
- 3.2.2 The laboratory shall define the minimum competence requirements included
 experience necessary for the panel leader. Sensory analysis must be carried
 out by a qualified and experienced panel leader possessing at least 2 years of
 experience in sensory analysis. In addition, the panel leader should have a
 university education in sensory science or be in possession of more specific
 education in sensory analysis and statistical analysis, and extensive knowledge
 of the sensory characteristics of the target products for sensory testing.
- 3.2.3 A special training is needed for panel leader besides sensory assessor training
 and should cover the intended sensory testing area, including at least:
 - a) selection of test procedures, experimental design and analysis;
 - b) product preparation and implementation of testing;
 - c) data input and processing;
 - d) reporting of results;
 - e) maintenance of records;
 - f) maintenance of all necessary supplies and services;
 - g) sensory assessor selection, training and monitoring procedures;
 - h) importance of the assessor's health and safety
- 260 261 More information is given in [5]

263 3.3. Sensory assessors

A sensory analysis panel is composed of people (sensory assessors) recruited from among the members of the laboratory, or from the organization to which it belongs or from external members and constitutes a true measuring instrument.

269 Sensory laboratories should have defined ethical principles of using human 270 subjects. The principles should focus on personal safety and voluntariness of 271 the assessors and confidentiality of all private information. Sensory assessors'

- safety is of paramount importance and should have precedence over all other
 considerations.
- The selection and training of sensory assessors needs to be carried out by experienced panel leader so that they can produce reliable results. The procedure must be documented.
- The use of references materials shall be considered so that the sensory assessors can compare their results to the assigned values. When this is not possible, other references such as solutions of different concentrations of certain molecules responsible for the sensory properties of the product (both positive and negative) or any other option that the panel leader considers technically acceptable, shall be used to help the sensory evaluators in their training.
- 287 The results of the training, re-training, and monitoring processes should be 288 evaluated by using statistical analysis tools, whenever possible.
- 290 Detailed guidance on selection and training of candidates intended to become 291 sensory assessors can be found in [3], [7], [11], [13, Part II], [14].
- 293 3.3.1 Selection

278

286

289

292

294

301

306

- 295 It is very important to select the candidates in relation to the aim of the sensory 296 test, in some cases it can be necessary to use experienced people in the target 297 products, though they cannot demonstrate experience in sensory evaluation 298 activities, for example in Protected Denomination de Origen (PDO) products; 299 but in other cases, prior knowledge of the product can be a serious handicap for 300 the panel to achieve objective results.
- 302 Consideration should be given to the personality (e.g. motivation, ability to 303 concentrate), personal habits and availability of the candidates, because they 304 could have a possible influence on the sensory test. The panel leader shall 305 conduct personal interviews with all candidates.
- The recognition and perception of odours and the basic tastes should be confirmed. Where relevant, colour vision, the detection of specific taints/odours and the person's ability to describe product characteristics should also be confirmed. The selection procedure should be established in a such way that ensures that the people with the best sensitivity and discriminatory skills can be chosen.
- 314 3.3.2 Basic training
- 315

- The penal leader shall instruct of
- The panel leader shall instruct sensory assessors to keep good practices before
 testing including not using any perfume and not eating and smoking at least one
 hour before testing.
- 319

- Special consideration should be given to the safety of sensory assessors. In
 addition, dietary, health and ethical considerations of sensory assessors should
 be recorded and considered.
- The areas covered shall include the use of the senses, familiarisation with the test procedure, and awareness of the effect of extraneous factors involved such as foods and perfumes.
- 328 Sensory assessors should be made aware about the types of products which 329 may be involved in the sensory test.
- If a candidate has enough specific education and experience in sensory
 analysis, he can be excused from the selection and basic training steps.
- 334 3.3.3 Specific training

323

327

330

344

347

352

354

359

- The training programme must be documented to ensure that each sensory assessor or the panel as a whole (in the case of panel training) is adequately trained for the tasks to be carried out. The programme must define levels of competence and other relevant requirements which shall be attained before sensory assessors are permitted to take part in a sensory test.
- 342 Objective measures, for example repeatability, reproducibility, trueness, and 343 discriminatory capacity should be used to assess the attainment of competence.
- 345 Comprehensive training records should be maintained for each member of the 346 sensory analysis panel.
- The ability to perform the test procedure should be confirmed. For example, this can be achieved by altering the concentration of a constituent in the sample and recording the results of the test, by the analysis of replicate samples or, for descriptive analysis, by testing using a range of a product type.
- 353 3.3.4 Monitoring

Individual performance of sensory assessors shall be monitored on a regular basis after training. Results, along with the date and product assessed, should become a part of the individual performance record. To help with this, the record system should be easily accessible.

- Results should also be monitored to investigate for any fatigue effect. If noted,
 the number of samples/session or sessions/day should be reduced and
 recorded.
- 364 Guidelines for periodic monitoring the performance of each sensory assessor 365 can be found in [6].
- 366 367

- 368
- 369

370 3.3.5 Re-training

371
372 Procedures and criteria shall exist for re-training if a sensory assessor has not
373 performed a test for a defined period, or if his/her results fall outside acceptable
374 limits.

In both situations, the sensory assessor shall not be included in the panel until
re-training is completed and the results demonstrate that they have regained
the competence required to participate in the sensory test.

The laboratory shall have a practice and documentation of expulsion (removing) a sensory assessor if he/she would not re-qualify for the panel.

383 3.3.6 Health factors

Health and related factors that might affect the performance of the sensory assessors should be recorded and consideration given to removing the sensory assessor from the test. Factors might include allergic reactions, colds, upset stomachs, toothache, pregnancy, certain medications and psychological stress.

At all times, sensory assessors should report to panel leader any ill effects they suffer.

393 4 FACILITIES AND ENVIRONMENT CONDITIONS

394 395 396

414

379 380

381 382

384 385

386

387 388

389 390

391

392

ISO/IEC 17025 clause 6.3

- 397 4.1. Environmental conditions are particularly important in sensory work as they 398 influence the results. The laboratory should provide appropriate environmental 399 conditions and controls necessary for the test being carried out. The testing must be performed in a specific area dedicated for the purpose. Normally, the 400 sensory facility shall be a quiet area free from distractions and with controlled 401 402 lighting, partitions between subjects to minimise visual contact, neutral colours for the walls, odour-free surfaces and appropriate ventilation. In addition, a 403 404 separate area for sample preparation should be provided. The test rooms for sensory analysis shall be designed as described in [8]. 405 406
- 407 4.2. The laboratory should be aware of the importance of good housekeeping and 408 the cleanliness of the test and preparation areas. If the sample preparation area 409 is not situated near the testing area, attention must be given to the transportation 410 of the samples and the maintenance of the correct serving temperature. The 411 access of sensory assessors to the preparation area should be controlled to 412 avoid the analysis being influenced by visual clues. This is particularly important 413 when the samples are being laid out prior to analysis.
- 4.3. Environmental conditions required for the analysis should be documented and
 where they are critical for performing the test they shall be monitored, controlled
 and recorded appropriately. For example, in temperature-controlled areas a
 maximum-minimum thermometer or a recording thermometer should be used
 to demonstrate effective control. These temperature measuring devices should

- 420 be included in the laboratory calibration programme and the calibration should 421 be traceable to national or international standards via an approved route.
- 4.4. For tests involving samples not at ambient room temperature, facilities must be
 available to bring the sample to the correct and homogenous temperature and
 to maintain it for the required length of time. Records that demonstrate the
 fulfilment of this requirement should be maintained.

428 **5 EQUIPMENT** 429

422

427

431

440

442 443

444

445

446 447

448

449 450

451 452

453 454

455

456

457 458

459

430 ISO/IEC 17025 clause 6.4

- 432 5.1 Regular maintenance and performance checks should be carried out to ensure that equipment meets the required performance specifications. The importance 433 of good housekeeping with respect to equipment is emphasised. Attention 434 should be paid to the possibility of contamination arising from the equipment or 435 436 cross-contamination from previous use. Equipment that is not directly used in analysis or examination, for example washing machines and water purifiers, 437 should be subject to an appropriate programme of maintenance and 438 439 cleanliness. Records of maintenance should be kept.
- 441 5.2 Equipment normally found in the sensory laboratory can be categorised as:
 - a) Sample preparation and storage equipment (eg ovens, hobs, microwave ovens, refrigerators, cold stores, freezers, food processors, knives, cutting devices)

Typically, equipment will be maintained only by cleaning and conducting safety checks, as necessary. Performance checks will be necessary where the setting can significantly affect the test result.

b) Measuring instruments and equipment (thermometers, timers, balances, flasks, devices for maintaining a specified temperature of the sample, etc.)

Correct use, combined with periodic servicing, cleaning, and, where appropriate, calibration will be necessary.

c) Sample serving equipment

460 The form this equipment takes is dictated by the samples and the 461 test method. In some products (e.g. wine, virgin olive oils) specific testing devices are required. All containers must be identical in 462 any one sensory analysis session. Glass or pottery utensils must 463 464 be cleaned thoroughly before use and kept solely for the purpose of sensory analysis. Where plastic cups and utensils are used, it 465 should be checked that they will not impart a taint. The use of 466 467 marker pens which give off a strong odour are to be avoided when coding the sample containers. 468 469

4706TRACEABILITY: REFERENCES471

472 **ISO/IEC 17025 clause 6.5.3**

- 474 6.1 Whenever possible, appropriate references for each sensory property shall be
 475 used in training and monitoring the performance of sensory assessors and in
 476 quality control of sensory methods. Furthermore, as far as possible, its use
 477 should allow the comparison of panels that apply the same sensory methods.
- 479 For many types of sensorial methods can be used references prepared within 480 the laboratory from chemical compound (e.g. molecules responsible for sensory 481 properties) of known purity and composition; in other methods it may be 482 necessary to use samples to which substances are added to bring about particular qualities, defects or positive attributes. The selection of internal 483 reference samples by the panel leader may also be necessary. The laboratory 484 shall establish a documented procedure for preparation of those in-house 485 486 reference materials. The laboratory shall establish acceptance criteria for such 487 materials and shall document the compliance of the material to those criteria.
- 488
 489 The availability of Certified Reference Materials is still very limited; on the other
 490 hand, it is possible to use, when they exist, samples from interlaboratory tests,
 491 although the laboratory shall assign a value based on the information available.
 492 This type of material is very suitable for quality control of sensory methods.
- 6.2 References shall be labelled clearly so that they are identified unambiguously.
 Information should be available to indicate preparation, shelf life, storage
 conditions, applicability and restrictions of use. All containers should be
 adequately labelled to indicate identity, concentration, date of preparation
 and/or expiry date.
- 500 Reference materials and standards should be handled in such a way as to 501 safeguard against contamination.
- 503 Personnel responsible for preparation and handling should be identifiable from 504 records.

506 7 SELECTION AND VALIDATION OF METHODS

507 508 509

505

493

499

502

473

478

ISO/IEC 17025 clause 7.2

- 510 7.1 Whenever possible, a laboratory shall use methods and procedures that are up
 511 to date and established as standard or by reputable technical organizations or
 512 by recognized scientific journals. When such methods are not available for
 513 sensory analysis, laboratory-developed methods should be used and these
 514 methods shall be properly documented and validated (ISO/IEC 17025, 7.2.2.1)
- 516 Detailed guidance on the selection of appropriated methods to verify the 517 compliance of PDO food products with sensory requirements according EU 518 regulation, can be found in [14]
- 519

520 521		
522		
523 524	7.2	Methods for sensory tests shall be documented and the following aspects at minimum shall be included:
525		a) Sanaany definitions of the selected conserve preparties
526		 a) Sensory definitions of the selected sensory properties b) Order of evolution of the sensory properties
527		b) Order of evaluation of the sensory properties
528		c) Instructions for sample preparation and serving conditions such as
529		temperature
530		d) Order of presentation of the samples to the sensory assessors, minimizing
531		physiological and psychological biases
532		e) Managing of testing session (usually a session is composed by one series
533		of samples), waiting time among series of samples, steps between samples
534		and maximum number of samples per day
535 536		 f) Minimum number required of sensory assessors to participate in a session; minimum number recommended is eight
537		g) Environmental conditions of the test room (e.g. temperature, light)
538		h) Equipment and materials (e.g. glasses, heaters, products for the elimination
539		of taste and flavour between samples)
540		 Methods for statistical analysis of results
541		j) Results and other information to be included in test reports (e.g. statements
542		of conformity)
543		
544	7.3	The tasting techniques for evaluating samples shall be documented and
545		available for sensory assessors during the evaluation sessions to assure that
546		all of them evaluate the samples in the same way.
547		—
548	7.4	The sensory assessors' responses shall be recorded on a sensory evaluation
549		sheet which will be a relevant technical record.
550		—
551		The evaluation sheet can only contain the necessary information related to the
552		sensory descriptors to be evaluated (for which the sensory assessors have been
553		trained) Therefore, it cannot:
554		
555		- Include meanings or names of the response levels on the scales that induce
556		the sensory assessors to evaluate subjectively.
557		- Include information that influences the sensory assessors, for example in
558		such a way that they can only assign certain sensory responses.
559		- Include any information from the evaluated sample that may influence the
560		sensory assessors or induce subjectivity in their evaluations.
561		- Incorporate the realization of calculations by the sensory assessors during
562		the sensory evaluation. The calculations are made from the result of the
563		sensory evaluation but not as part of it.
564	7 5	When any prints offer the such as a supremy assessment for times assessing for times
565	7.5	Where appropriate, effects such as sensory assessor fatigue, session fatigue
566		and sensory assessor comfort should be addressed by careful attention to
567 568		experimental design, a balanced presentation of samples and, where necessary, allowing sufficient time between tests.
569		necessary, anowing sunicient time between tests.
003		

570 7.6 Validation of laboratory-developed methods is required to demonstrate that they
571 are suitable for their intended purpose. It shall be carried out considering the
572 panel as a whole and at least with the minimum number of sensory assessors
573 established. Validation should be carried out through panel sessions conducted
574 specifically for the purpose of obtaining performance data or using data already
575 available.

577 The validation procedure shall consider the performance characteristics of the 578 panel as a whole: repeatability, reproducibility, consistency of sensory 579 assessors' responses and discriminating ability. Definitions are given in [6] 580

- The validation procedure shall include, at least:
- a) Experimental design (number of sensory assessors, samples, replicates and sessions)
- b) Samples used (for example, in terms of identification or quantification of attributes for food quality control, the selected samples should be both appropriate and non-appropriate products)
 - c) Methods for statistical analysis of results

Validation results shall be recorded in a validation report, including the analysis to determine the above-mentioned performance characteristic of the method, and should allow to establish criteria for the quality control of the method.

Guidelines for monitoring the performance of a panel can be found in [6]

596 8 HANDLING OF SENSORY TEST ITEMS

592 593 594

ISO/IEC 17025, clause 7.4

- 8.1 Sample packaging, and instruments used for sample manipulation, should be selected so that no surface in contact with the sample will impart any taint or introduce any microbiological or chemical hazard. The seal of the sample package should be adequate to prevent leakage of the sample from the container and prevent contamination.
- 606 8.2 The sample label is important and should unambiguously identify the sample to 607 related plans and sample register. Further into the analytical process, labelling becomes particularly important as the sample may have been divided and sub-608 sampled. At that stage, additional information such as references to the main 609 610 sample and to any processes used to take the sub-sample, may be appropriate. 611 Labelling should be firmly attached to the sample packaging and where 612 appropriate, be resistant to fading, sample spillage, and reasonable extremes of temperature and humidity. 613
- 8.3 Samples should be stored so that the integrity of the samples is preserved.
 Storage areas should be kept clean and organised. Extremes of environmental
 conditions, which might change the sensory attributes of the samples, should
 be avoided. If necessary, environmental monitoring should be used. An
 appropriate level of security should be exercised to restrict unauthorised access

to the samples. The samples will be labelled objectively and neutrally (for
example: by random numbers).

- 8.4 Food samples submitted for analysis may often require special storage
 conditions such as refrigeration or freezing. In such cases, laboratories should
 store samples under appropriate conditions and maintain, monitor and record
 such conditions in order to demonstrate that specific requirements are being
 met.
- 8.5 It is of paramount importance to develop written procedures that include all the details of sample preparation (cutting, unfreezing, toasting, boiling, cooking, roasting etc, when used). These descriptions should be as comprehensive as possible to ensure that any sample will be treated always in the same way, which will improve the repeatability of results. For example, when boiling potatoes: amount of water, salt, time of cooking, average size of potatoes, etc. should be described.
- 637 8.6 When appropriate, the laboratory should establish procedures for handling and 638 preparing any new sample types.
- 6408.7The laboratory should have a documented policy for the retention and disposal641of samples after testing.

ISO/IEC 17025 clause 7.5

- 647 9.1 Technical records for each test shall include all the information needed to
 648 ensure that any test could be repeated in conditions as near as possible to the
 649 original test.
- 9.2 In sensory analysis, the following information are especially important and shallbe recorded:
- a) Evaluation sheets fulfilled by the sensory assessors during the sessions for
 each sample evaluated including date, time, assessor's code and position,
 sample identification code, sensory responses and assessor's signature or
 equivalent mark
 - b) In each session, the order of presentation of each sample to each sensory assessor
 - c) Preparation and coding of samples, equipment used and personnel who carry it out
 - d) Environmental conditions from the taste room and from the sample preparation area
 - e) Where applicable, conditions (e.g. temperature) of samples or controls performed to verify them
 - f) Supervision performed by the panel leader
 - g) Statistical analysis of sensory responses performed by the panel leader
- 668 h) Calculations
 - i) Quality control evaluation performed by the panel leader

10	UNCERTAINTY OF MEASUREMENT	
	ISO/IEC 17025 clause 7.6	
	Sensory tests come into the category of those that a strategy on evaluation measurement uncertainty need to be developed by the scientific community	
	In some cases, when a quantitative testing is considered, it can be sufficien report only the reproducibility.	
	Guidance on the implementation of uncertainty evaluation in testing can found in [15]	
11	QUALITY CONTROL	
	ISO/IEC 17025, clause 7.7	
11.1.	Internal quality control	
11.1	The laboratory shall apply appropriate procedures for monitoring th performance of the panel (as a whole) and to demonstrate the validity of in results.	
11.2	The ways in which internal quality control should be carried out include:	
	 a) Replicate analysis of samples for checking panel repeatability; recommended frequency is each tasting day; this control shall be us for monitoring the panel as a whole and individual sensory assessors t b) Analysis of references (e.g. samples from interlaboratory, inter samples selected by panel leader, other characterised materials); recommended frequency is each month; this control could be used i monitoring the reproducibility, and trueness (when possible) of the pare evaluating its discriminating ability and also monitoring individ assessors (e.g. individual deviation from panel results) c) All the results of the panel for each sample shall be checked consistency of sensory assessors' responses. 	
11.3	The references and samples used for quality control should be representative to cover over a year different type of samples and all sensory propertie evaluated.	
11.4	The controls indicated at 11.2 can be used for monitoring individual sens assessors.	

720					
721 722	11 2	External quality assessment (proficiency testing)			
723	11.2.	External quality assessment (pronciency testing)			
724 725 726		If available, laboratories shall participate in proficiency testing which are relevant to their scope of accreditation, preference should be given to proficiency testing schemes which use appropriate matrices.			
727 728 729	12	REPORTING OF RESULTS			
729 730		ISO/IEC 17025, clause 7.8			
731		130/1EC 17023, clause 7.8			
732 733 734	12.1	The report shall adequately describe the results of all sensory properties of the sample assessed by the panel.			
735 736	12.2	The sensory report shall be authorized by the panel leader.			
737 738 739 740	12.3	The information relating to the sensory evaluation of the sample shall be included in the sensory analysis report, noting in particular the description of the sample, the sensory method and the statement of conformity when it is requested.			
741 742 743 744 745 746	12.4	In relation to the statement of conformity of the reported results, it shall be carried out by the panel leader and it consists of evaluating the results of the sensory analysis against the specifications or organoleptic requirements (e.g., from an EU PDO product).			
748 747 748 749 750 751 752 753 754 755		It is necessary that the laboratory sets documentary evaluation criteria used to declare conformity or non-conformity with the aforementioned requirements. In the test report, together with the declaration of conformity, the appropriate identification of the specifications and the document containing the evaluation criteria, must be also identified (for example, indicating its revision status and /or date of approval). The document containing the evaluation criteria should be approved (e.g. by the PDO "Control body") or published by the competent authority			
756	13	NONCONFORMING WORK			
757 758 759		ISO/IEC 17025, clause 7.10			
760 761 762	13.1	The panel leader shall apply its nonconforming work procedure when the results of the continuous monitoring activities of the sensory assessors or the panel do not fulfil the previously established criteria.			
763 764 765	13.2	Examples of nonconforming works in panel monitoring are:			
766 767		- If the established criteria for panel repeatability are not fulfilled (for example, a high percentage of the total evaluated sensory descriptors is not			

767a high percentage of the total evaluated sensory descriptors is not768repeatable), the panel leader should take a decision on the acceptability of

- 769 the samples results, as it is not demonstrated that the panel has performed in a repeatable way. 770 771 _ If the established criteria for panel consistency of sensory assessors' responses (for example, maximum acceptable difference between the 772 response of each sensory evaluator vs. the result of the panel as a whole) 773 774 is not fulfilled for each sensory property evaluated in each sample evaluated or, at least, for a minimum percentage of evaluated sensory descriptors in 775 the sample, the panel leader must cancel the sample and it shall be 776 evaluated in another session before reporting its results. 777 If a sensory assessor does not fulfil the established criteria for individual 778 monitoring, the panel leader should decide whether it is necessary for him 779
- to lose his qualification, temporarily leave the panel and re-train before deciding to re-enter the panel again.
